Dolphins

Dolphins are one of the most intelligent animals and have curved mouths that look like they are smiling. They are mammals that live in groups in shallow seas worldwide. They have a smooth body for swimming at high speeds and are usually grey. Dolphins breathe through a hole in their heads and can make and sense frequencies of sound ten times higher than people can hear. They are one of the very few animals with a neocortex, which means they can think independently, understand language and emotions, teach their children, cooperate, and socialize. Dolphins see other mammals as friends and will protect or help when needed, including saving people from drowning or protecting them from sharks.
