Monuments

The whole world is covered in the treasures of the past, from tiny pieces of jewellery to great buildings and monuments. Some of these monuments are ancient, others are more recent, but every country has a history of which it can feel proud. The great pyramids of Egypt are famous around the world, as is the Great Wall of China. The beautiful cathedrals of Germany seem to reach to the sky, while the castles of England stand as firm and as imposing as the rock on which they are built. Yet humans are still building monuments. Dubai has the tallest building in the world. The Large Hadron Collider at CERN tests the speed of light itself and is so huge that is stretches underground through two countries. And, in space, we have built a space station – a monument that is not even part of the Earth.
